

Document Customizer

Customize and layout your document in only minutes

Document Customizer is the app that enables you to easily:

- customize documents
- edit any text
- insert data from any field
- edit design and layout
- manage language versions
- create customer specific versions

Apply language versioning

Select language whenever you generate or print any document. The same document can be produced in any language you like.

Language versioning also applies to captions, values and item names. Print an invoice in Danish, and “pcs” will change to “stk”.

Prebuilt documents

You get prebuilt templates for 20 documents – ready to use. We have analyzed what Document Customizer is used for – and we have included the most popular customizations in the 20 document templates.

Create customer specific templates

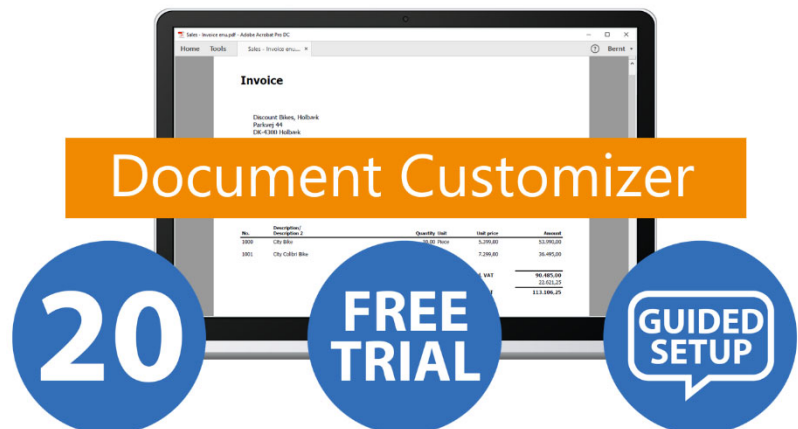

Use templates to quickly apply a visual identity to your document. Create as many templates as you like – and select a template when you generate the document.

Apply a template to a customer if you like, and it will be the default template for the specific customer. If you generate multiple invoices, you will see invoices in different layouts depending on the template selected on each customer.

Customize the layout

You may customize the title of the document, the bill-to and ship-to address and edit any general header information. Change any general footer information. Add generic text in 3 predefined sections right below the header and just before the footer.

And much more ... You can install Document Customizer in only minutes. A wizard will guide you. No technical skills required to get started.

Available from Microsoft AppStore
