

IDOS has solved the biggest challenge in accounting & finance by automating:

- End to end process of accounting & finance, including the activity that precedes the actual recording of the transaction in the ledgers. This ensures availability of accurate, complete and real-time actionable data.
- Real-time compliance to internal controls relevant for every transaction overcoming potential oversight or error by the user in terms of compliances.
- Validation, application, computation and accounting of taxes applicable to every transaction (without the need for the user to be knowledgeable about taxation).
- Logical integration of all modules, which can either be deployed in totality or in a modular manner to complement existing ERPs.

Fact 1:

Tally / QuickBooks / SAP / Oracle and other solutions have steep learning curve and can not be used by someone who has no knowledge of software, accounting, taxation or finance. **IDOS on the other hand is very simple to use, even by a person who has no prior experience in domain or technology.**

Fact 2:

Existing solutions are difficult to integrate, create issues during consolidation and require additional process, effort & cost for integration and for migration into other solutions for analytics. **IDOS has been built in a logical sequence making it seamless for integration.**

Fact 3:

ERPs and accounting software are rigid,, making adoption a challenge & customization difficult. **IDOS philosophy is simple, “do what you are used to doing, in the manner in which you are used to, but more efficiently, through automation”.**

IDOS helps plug the gap between existing ERPs and systems, by providing logically built modules which can seamlessly integrate with existing systems and provide the last mile solutions to overcome specific challenges in accounting, finance, reporting & analytics.
